

AUTHOR ACTION SUMMARY

Luke Martin — Truncated Octahedron Face Graph, Draft 10

Recommendation: Conditional minor revision. No major mathematical defect established in this round. The new adjacency-rule/Lean-matrix bridge is substantive and accurately bounded; full release replay remains outstanding.

1. **Required: independently replay the release.** Freeze `face-graph-note-v10`; execute the complete Python runner and pinned Lean build in a clean checkout, including dependency install and printed theorem axiom lists. Preserve the logs, nonzero exit cases and checksums. This review did not perform that tagged execution.
2. **Required for final public deposit:** supply a permanent, immutable Zenodo DOI (or comparable archival identifier) containing the manuscript, scripts, full Lean tree, certificates, supplementary checkers, CSV and plot. Cite its exact tag or commit.
3. **Preserve current scope distinction:** the new `Graph.lean` connects rule-defined matrices to formal polynomials; the proof that those combinatorial rules describe the physical polyhedron and its outward holonomies remains a printed/independently computational claim, not a Lean theorem.
4. **Optional:** shorten procedural review history only to the extent permitted by full and accurate scholarly attribution; retain author responsibility.

Recommendation reversal: a reproducible geometric-rule mismatch, incorrect quarter-flux plaquette holonomy, or central rule-to-matrix mismatch would require serious reconsideration. A release-only installation issue instead requires repair and a new test, not automatic rejection of the mathematics.

This checklist accompanies the full scientific referee report and is not a substitute for its evidence and explanations.
